

8000 FAMILY AND 6000 FAMILY – 2011 UPGRADE

Datalogic Automation announces the availability of new features and installation tools for 8000 and 6000 Families.

The new features are implemented in the 6.80 Software Version available in production starting from February 1st.

The new software package and tools offer Automatic PackTrack Calibration (with significant installation time reduction) and improvements in term of system reliability and performance.

Another important innovation, the “Energy Saving” function, applies smart scan engine management, stopping electrical motor rotation when no parcels are running on the conveyor for a defined period of time.

“Energy Saving” will therefore extend products’ lifetime and will also reduce significantly power consumption during standby period.
